# KUBIG 23-1 NLP 분반 논문리뷰

# BERT 기반 Model 논문 리뷰

2023.02.23 16기 이영노

# **Table of Contents**

- I. BERT
  - 1) Architecture
  - 2) Pre-Train 방식
  - 3) Input/Output Representation
  - 4) Embeddings
- II. 4 Ways to Go Beyond

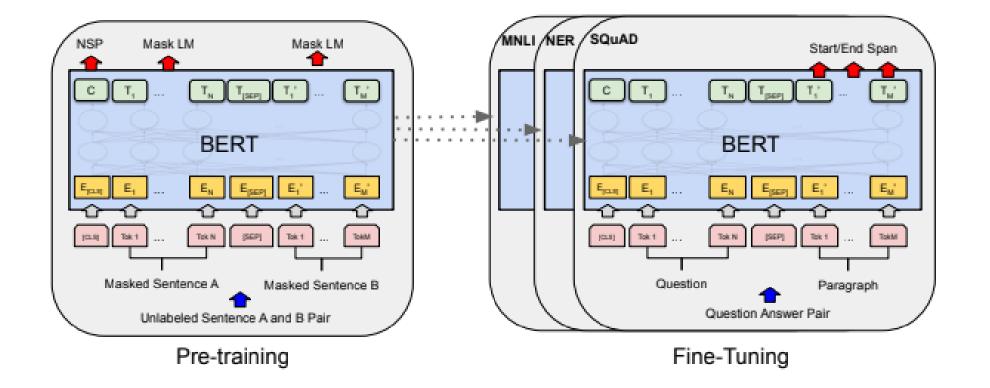

III. span BERT

IV. RoBERTa

V. ELECTRA

# Motivation

- Two approaches for Pre-Training
- Feature based approach : Task Specific (Embedding: ELMo) 기존 input에 pre-trained representation 을 feature로서 추가
- Fine-tuning approach : Task Agnostic (GPT, BERT)
   최소한의 task specific parameter를 추가하여
   모든 pre-trained parameter를 조금만 바꿔주는 방식

#### I. BERT

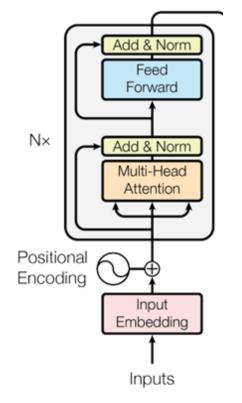

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

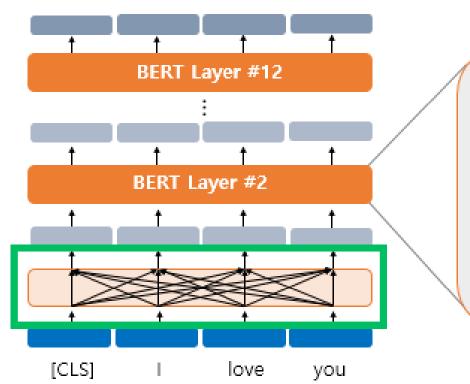

II. 4 Ways to Go Beyond

# 1) Architecture

- Transformer의 Encoder부분만 사용하여 Self Attention을 통해 문맥을 학습
- Parameters
- L = number of Layers (Transformer block)
- D = d\_model
- A = number of Heads in Multi-head Attention layer
- cf. same model size as GPT-1 for comparison

	Transformer	BERT
L	6	12
D	512	768
А	8	16

#### I, BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

II. 4 Ways to Go Beyond

III. span BERT

**FFNN** 

# 2) Pre Train 방식

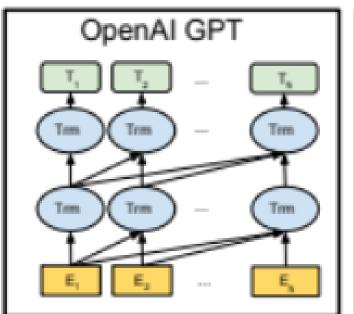

- 2-1) Masked LM: 임의의 순서에 해당하는 부분을 masking
- Q. input은 masking되지 않은 raw data. 그럼 masking을 어떻게?
- A. Train data generation for training and fine-tuning
- choose 15% of random token positions for prediction from the chosen i-th token position
  - 1. replace token with [MASK] for 80%
  - 2. replace token with [random token] for 10%
  - 3. replace token with [original token] for 10% (Fine-tune 할때는 fine tune input 이masking된 데이터가 아니므로, pre-train data와 gap이 생김. 이를 3번을 통해 해결)
- cf. suitable for NER, MNLI cf. comparison btw ELMo, GPT and BERT

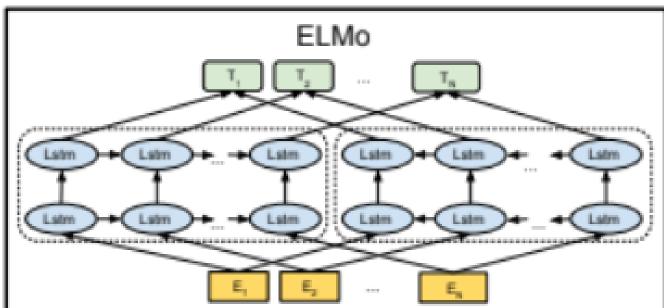

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings
- II. 4 Ways to Go Beyond

- I. BERT
- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings
- 4 Ways to Go Beyond
- . span BERT
- '. RoBERTa
- , ELECTRA

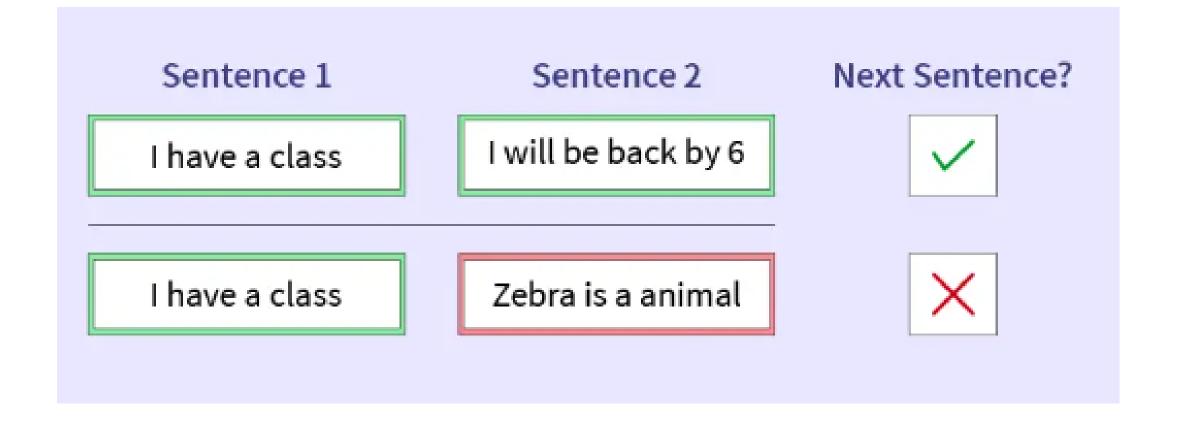

- ELMo : Biderictional 한 sequential input
- BERT : Biderctional 한 non sequential input
- BERT : Masking 이 random 하게 (bidirectional)
- GPT : Masking이 자기보다 뒤쪽에만(unidirectional)

# 2) Pre Train 방식

## 2-2) Next Sentence Prediction:

- 문장 간 관계를 고려해주기 위한 방법
- IsNextSentence : 1, NotNextSentence : 0 으로 labeling해줌
- 두개의 비율은 5:5로 설정

cf. suitable for QA, NLI

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

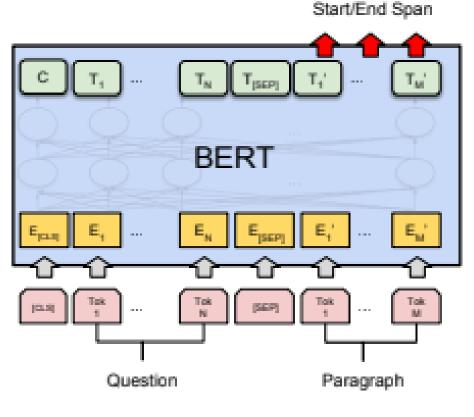

II. 4 Ways to Go Beyond

# 3) Input/Output Representation

- Sentence : 통상적인 문장의 의미X, 문장의 연속 arbitrary span of contiguous text
- Sequence : set of sentences (sentences packed together)
- C: binary TASK (sentiment classification, similarity, NSP, etc)
- T: final hidden vectors (prediction, QA)

# 

(a) Sentence Pair Classification Tasks: MNLI, QQP, QNLI, STS-B, MRPC, RTE, SWAG

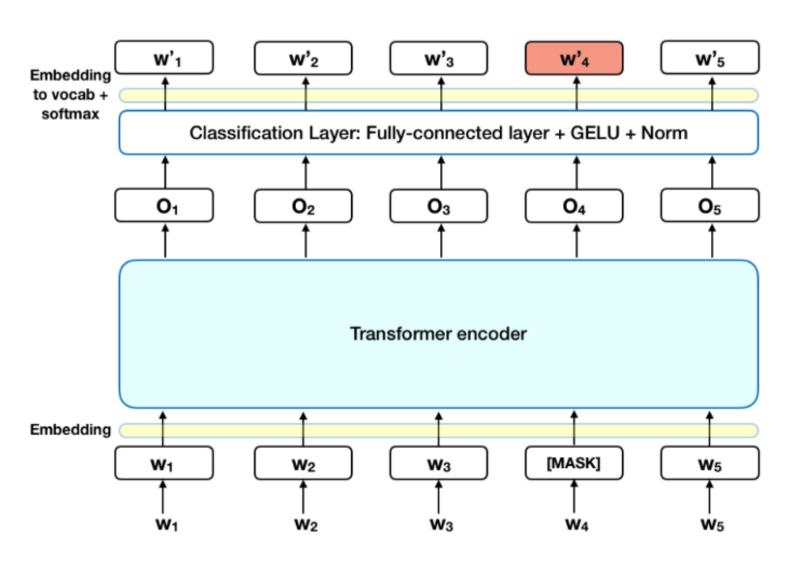

(c) Question Answering Tasks: SQuAD v1.1

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

II. 4 Ways to Go Beyond

# 4) Embeddings

 Token Embedding: Word-Piece subword tokenizer Deal with OOV problem

30522

512

• Position Embedding : 순서위치 정보(학습가능)

• Segment Embedding: 문장을 구분해주기 위한 임베딩

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

II. 4 Ways to Go Beyond

# II. 4 Ways to Go Beyond

1. Pre Train Method 사전훈련 방식 개선을 통한 성능 향상 spanBERT, RoBERTa, ELECTRA, XLNet, ALBERT, BART, GPT3, T5

2.AE + AR

#### AE의 문제점

- [MASK] token이 독립적으로 예측 (independent assumption)되기때문에 token사이의 dependency는 학습할 수 없음
- Finetuning 과정에서 [MASK] token이 등장하지 않기때문에 pretraining과 finetuning사이에 discrepancy 발생

AR의 문제점

단일 방향 정보만 이용하여 학습 가능함

XLNet, BART, T5, DeBERTa-MT

- 3. Model Efficiency : 더 적은 parameter, 더 적은 computation **ELECTRA**, ALBERT
- 4. META Learning GPT3, T5

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

#### II. 4 Ways to Go Beyond

# III. spanBERT

# **Motivation**

- BERT Pre Train 방식 : MLM, NSP
- "Denver Broncos" 가 "NFL팀" 인지 결정하는 것은 "어떤 NFL팀이 슈퍼볼 50에서 우승했습니까? 라는 질문에 대답하는데 중요함. 그러나 Denver Broncos는 두개의 단어가 합쳐진 형태이기에 예측하는데 어려움이 있음
- Denver Broncos 를 한꺼번에 예측하는 것은, 각각의 단어를 예측하는 task보다 어려운 문제.
- cf. QA, Conference Resolution(문맥군집화)
  - => Pre Train 방식의 개선으로 해결
  - => 성능 향상을 위해 NSP삭제, SBO추가

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

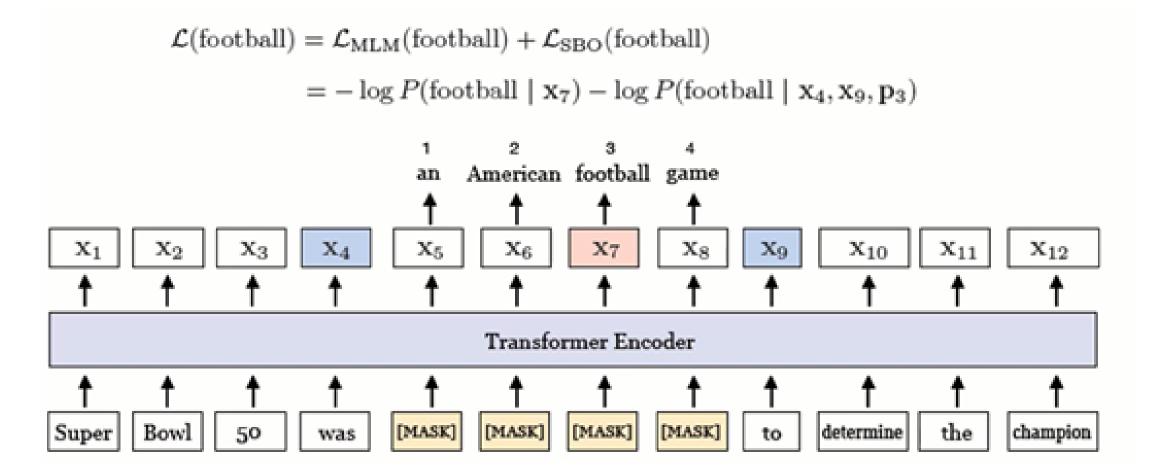

II. 4 Ways to Go Beyond

#### III. span BERT

IV. RoBERTa V. ELECTRA

# Model

- Span Masking: BERT의 random masking 대신에,
   한개 이상의 연속된 토큰을 masking
- mask span의 length ~ Geo(0.2) wh. max(length) = 10
- Span Boundary Objective : span masked 된 영역의 boundary에 있는 x4, x9 토큰도 예측에 활용
- Single Sequence Training : NSP 삭제 context form other document adds "Noise" to the MLM.

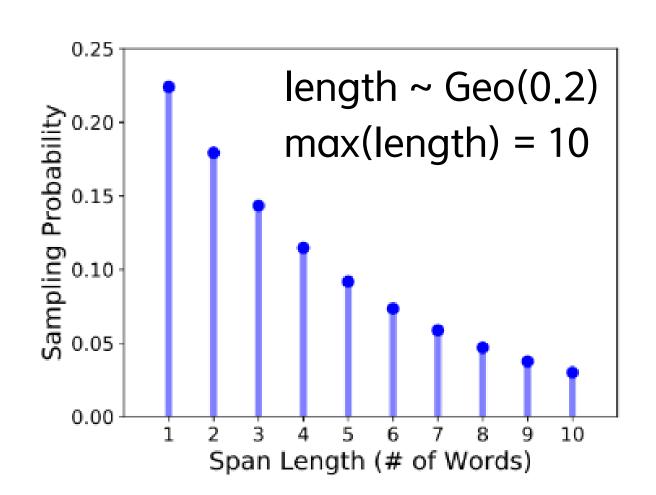

#### I, BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

II. 4 Ways to Go Beyond

## III. span BERT

IV. RoBERTa V. ELECTRA

# Motivation

- BERT는 "Under-Trained" 되었다는 가정에서 시작 가장 "최적화된" BERT 모델을 만들어보자!
- Sampling bias from Random Masking
   BERT는 pre train 전에 raw data에 대해 masking 진행
   그러나 이 과정에서 random masking 에 기인한 sampling bias 발생 동일한 token이 selected 되어 masking이 진행될 수 있음
  - => 동일한 데이터에 대해 masking을 10번 다르게 적용
  - => Input이 들어갈때마다 masking을 진행

Masking	SQuAD 2.0	MNLI-m	SST-2						
reference	76.3	84.3	92.8						
Our reimplementation:									
static	78.3	84.3	92.5						
dynamic	78.7	84.0	92.9						

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings

II. 4 Ways to Go Beyond

III. span BERT

IV. RoBERTa

V. ELECTRA

# Model

- more data, more batch size, longer sequence size (BERT는 d\_model = 512, but Pre-Train 과정에서 512인 sequence를 10% 만 사용함)
- NSP 제거 (성능)
- Dynamic Masking : 동일한 데이터에 대해 masking을 10번 다르게 시행 Input이 들어갈 때마다 masking 진행
- Byte Pair Encoding : 빈도수에 기반하여 가장 많이 등장한 쌍을 병합

#### I. BERT

- 1) Architecture
- 2) Pre-Train 방식
- 3) Input/Output Representation
- 4) Embeddings
- II. 4 Ways to Go Beyond

III. span BERT

# **Motivation**

- 전체 토큰중 masked된 15%에 대해서만 학습 (비용)
- pre train 시에 mask token을 참고하지만, 실제로 이것은 학습을 위한 변형 일뿐 실제로는 mask token 이 존재하지 않아 fine tune시 gap 발생.
  - => Generator을 이용해 input의 일부 토큰을 예측
  - => Discrimator가 binary classification을 통해 전체 데이터를 학습 (전체 데이터에 대해 학습) (ELECTRA-Small 의 경우 BERT-Large대비 1/20 parameter, 1/4 computaion 으로 GLUE Score가 5 point 더 좋은 성능을 보였음)

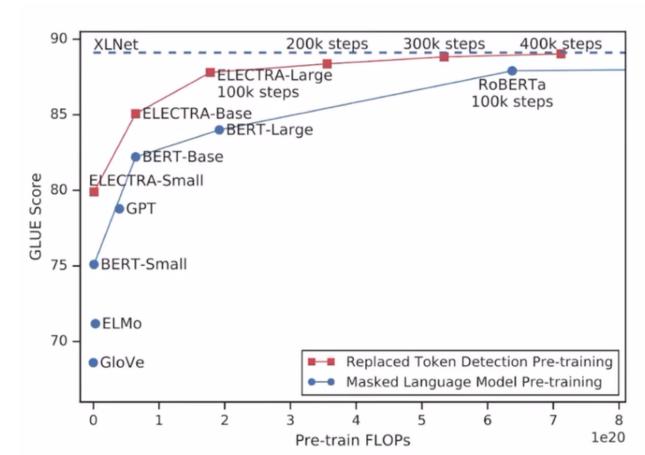

#### I. BERT
